The Presentation assignment

- It is 25% of the final grade.
- It includes:
 - A written PPT Presentation - 35% of the grade
 - An oral presentation - 55% of the grade
 - An oral answer regarding one article - 10% of the grade

The Presentation assignment

SCE
SHAMOON COLLEGE OF ENGINEERING
SCE FOR A BETTER WORLD

Conclusion/s or Summary

- What conclusion/s can we draw from the data presented here?
- Present your opinion about the topic.
- Optional – directions for future R&D.
- Despite the difficulties, the mission staff is very optimistic and confident that enough sample was dugged from Bennu.
- In my opinion, the mission is unnecessary because _____.
- Scientists will study % of the regolith, 75% of the sample is reserved for study by future generations of scientists using new analysis techniques.

Think Forward. **Think SCE.**

Oral Article Analysis

Working with a Scientific Article - Advanced B

Prepare to answer the following questions orally:

- What inferences can be drawn from the title and subtitle of the article?
- How is the purpose of the research defined in the article? / What is the definition of the purpose of the research provided in the article?
- What do the statistics presented in the article demonstrate?
- What is/are the conclusions/conclusions of the research?

Think Forward. **Think SCE.**

SCE

 - that does **not** appear on this list:

List of Unacceptable and Taken Presentation Topics

NASA's OSIRIS-Rex Mission

Choosing a method of presentation:

- advantages and disadvantages/pros and cons
- comparative/contrast
- in-depth look at an issue
- cause and effect

In this presentation I will present the mission in general and the sampling procedure in particular.

*It's a recommendation only!

Scientific Sources

- You must use at least **five** sources. They all must be cited in the presentation.
- They all must be in English.
- They all must be from academic, governmental or NGO source. You can use the library databases to access them:

[Google Scholar](#)
[Library Database](#)

- No Wikipedia, no advertisements, no howstuffworks.com, etc.

OSIRIS – REx Mission

Name: Anrieta Levi

I.D: 123456789

Department: The English Unit

Course: Advanced B

Lecturer: Anrieta Levi

Date: 17.3.26

Introduction

Why?*

- Why did you choose the topic?
- Why is it interesting/important?
- Is it something we didn't know before?

- I chose this topic because I am a big fan of NASA.
- This is the first time NASA attempts to take a sample from an asteroid and bring it back to Earth for future exploration.
- The mission may shed light on how the Solar System was formed.

*It's a recommendation only!

Introduction – cont.

What?

- A slide about the topic of presentation – background, definition, very brief history.

- Osiris - REx is NASA's first asteroid sample return mission.

The main objectives of the mission are: _____

Introduction
Origins Spectral Interpretation Resource Identification Security
Regolith Explorer

- Osiris - REx is NASA's first asteroid sample return mission. [1]
- OSIRIS-Rex's objective - to travel to a near-Earth carbonaceous asteroid, study it in detail and return to Earth with a regolith sample. [2]

Body of presentation

Here you develop your main thesis:

- Facts
- Recent developments
- Relevant data
- Explanation of process
- Results
- Etc.

EXAMPLE

The Spacecraft [3]

Think Forward. **Think SCE.**

Body of presentation – cont.

- Designate a slide for every subtopic.
- Use bullets.
- Use proper register and style!
- Use relevant illustrations, tables, charts, etc. Explain them!

Body of Presentation – cont.

Flat Bar Chart Diagram

This is a sample text. Insert your desired text here.

Body of Presentation – cont.

TROUBLESHOOTING FLOW CHART

Conclusion/s or Summary

- What conclusion/s can we draw from the data presented here?
- Present your opinion about the topic.
- Optional – directions for future R&D.
- Despite the difficulties, the mission staff is very optimistic and confident that enough sample was snagged from Bennu.
- In my opinion, the mission is unnecessary because _____.
- Scientists will study $\frac{1}{4}$ of the regolith. 75% of the sample is reserved for study by future generations of scientists using new analysis techniques.

*It's a recommendation only!

Summary and a Look to the Future

- This sample will provide an insight into the initial states of planet formation and the origin of life.
- Scientists will study a quarter of the regolith. Seventy-five percent of the sample will be preserved for study by future generations of scientists using new analysis techniques. [3]

References in the Text

Osiris - REx is NASA's first asteroid sample return mission. [1]

Asteroids are geologic remnants from the early Solar System. [2] [3].

Pay Attention

- A presentation with no documentation of academic sources will be graded **zero**.
- Reading the whole presentation or any section of it from any device, a sheet of paper or slides will result in a **zero grade**.
- Each slide must include the college logo.
- The presentation should include no less than 6 slides and it should last no more than 5 minutes.
- No sound effects – respect your audience!

Pay Attention – cont.

- Your slides should be neat. Try not to use different fonts.
- No animation effects in order to maintain an eye-friendly design.
- Learn the pronunciation of technical terms.
- Synchrony and relevancy of oral and visual content

Oral Article Analysis

- Choose one of the articles you used in your presentation.
- Prepare to answer these questions orally.
- You'll be asked one of these questions after giving the presentation.
- No points will be given for reading the answers.

Working with a Scientific Article – Advanced B

Prepare to answer the following questions **orally**:

1. What inferences can be drawn from the title and subtitle of the article?
2. How is the purpose of the research defined in the article? / What is the definition of the purpose of the research provided in the article?
3. What do the statistics presented in the article demonstrate?
4. What is/are the conclusion/conclusions of the research?

Oral Article Analysis

Working with a Scientific Article – Advanced B

Prepare to answer the following questions **orally**:

1. What inferences can be drawn from the title and subtitle of the article?

The inferences that can be drawn are the following:

- The article will provide a thorough description of the OSIRIS-Rex spacecraft.
- The article will focus on the Touch-and-Go Sample Acquisition Mechanism (TAGSAM).

2. How is the purpose of the research defined in the article? / What is the definition of the purpose of the research provided in the article?
The purpose of the article is to show that the OSIRIS-REx spacecraft is designed to provide a platform that achieves the mission's science objectives.

3. What do the statistics presented in the article demonstrate?

The statistics present the ability of TAGSAM to collect different amounts of collected particles according to size, density, weight, etc. per second.

4. What is/are the conclusion/conclusions of the research?

Extensive tests in the laboratory and onboard a series of reduced gravity aircraft flights, as well as analysis of the gas dynamics, indicate that the scientists can expect a successful sampling event for a wide particle-size range, including those expected on the surface of the asteroid Bennu.

Show the details and the abstract
of the article you chose for oral analysis.

Abstract The Origins, Spectral-Interpretation, Resource-Identification, Security and Regolith-Explorer (OSIRIS-REx) spacecraft supports all aspects of the mission science objectives, from extensive remote sensing at the asteroid Bennu, to sample collection and return to Earth. In general, the success of planetary missions requires the collection, return, and analysis of data, which in turn depends on the successful operation of instruments and the host spacecraft. In the case of OSIRIS-REx, a sample-return mission, the spacecraft must also support the acquisition, safe stowage, and return of the sample. The target asteroid is Bennu, a B-class near-Earth asteroid roughly 500 m diameter. The Lockheed Martin-designed and developed OSIRIS-REx spacecraft draws significant heritage from previous missions and features the Touch-and-Go-Sample-Acquisition-Mechanism, or TAGSAM, to collect sample from the surface of Bennu. Lockheed Martin developed TAGSAM as a novel, simple way to collect samples on planetary bodies. During short contact with the asteroid surface, TAGSAM releases curation-grade nitrogen gas, mobilizing the surface regolith into a collection chamber. The contact surface of TAGSAM includes “contact pads”, which are present to collect surface grains that have been subject to space weathering. Extensive 1-g laboratory testing, “reduced-gravity” testing (via parabolic flights on an airplane), and analysis demonstrate that TAGSAM will collect asteroid material in nominal conditions, and a variety of off-nominal conditions, such as the presence of large obstacles under the TAGSAM sampling head, or failure in the sampling gas firing. TAGSAM, and the spacecraft support of the instruments, are central to the success of the mission.
